PQHS 471 Machine Learning & Data Mining Lecture 1: Introduction

Jan 16, 2024

Introduction Jan 16, 2024 1 / 43

Syllabus

Instructor

- Hao Feng, Ph.D.
- Assistant Professor, Population and Quantitative Health Sciences, Case School of Medicine
- Email: hxf155@case.edu
- Office hour: Thursday 3:45-4:30pm.
- Office: Robbins Building E-208.
- Research Interests
 - Biostatistics, Bioinformatics, High-throughput Data, -omics.

Introduction

Teaching Assistants

- Daoyu Duan
 - PhD student in Epidemiology and Biostatistics
 - Email: dxd429@case.edu
 - TA office hour: Wednesday 2PM-2:45PM over Zoom
- Leslie Meng
 - PhD student in Epidemiology and Biostatistics
 - Email: gxm324@case.edu
 - TA office hour: TBD

- Class Time
 - Tuesday & Thursday, Jan/16/2024 Apr/25/2024
 - 2:30PM 3:40PM
- \bullet 6 \sim 7 sessions will be hands-on programming lab sessions (laptop required).
- Key Dates
 - Mar 7, Midterm Exam
 - Mar 12, NO class (Spring break)
 - Mar 14, NO class (Spring break)
 - Mar 21, NO class (conference)
 - April 25 is the last day of class.

Introduction

• Prerequisites:

• PQHS 431: Statistical Methods I.

• Nice-to-haves:

 Additional knowledge in Linear Algebra, Basic Probability and Statistical Inference are extremely helpful for a thorough understanding of algorithms introduced in this course.

Evaluation:

- Homework (65%): Six sets of unequally-weighted, applied, R
 programming-based assignments. Due dates and submission method
 will be announced with assignments. Late homework submission: 15%
 penalty upfront + additional 10% penalty each day.
- Midterm exam (25%): In class, closed book.
- Class participation (10%).

Introduction

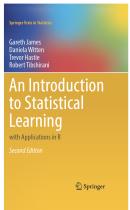

Academic Integrity

Students are expected to complete all homework assignments ALONE, without collaboration with others. However, consulting the TAs is allowed. Students are expected to uphold standards of academic integrity. Procedures will be taken for academic misconduct:

Introduction

Topics:

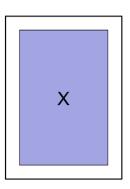

- Dimension Reduction
- Similarity measures, k-means, Hierarchical Clustering
- Frequent Pattern Mining
- Fundamentals in Supervised Learning
- Decision Tree, Bayes Classifier, KNN
- GLM, LDA, QDA
- Cross-Validation and Bootstrap
- Tree and Forest, Tree based method
- Bagging, Boosting
- Support Vector Machines
- Neural Network
- (intro) Deep Learning

Supervised vs. Unsupervised

X : independent variables, predictors, explanatory variables y : dependent variables, outcomes, response variables

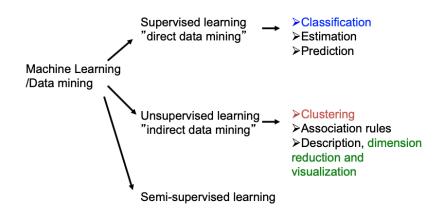

Supervised Learning

Unsupervised Learning

10 / 43

Supervised vs. Unsupervised

1

Introduction Jan 16, 2024

11 / 43

¹Modified from Figure 1.1 from Data Clustering by Gan, \triangle Ma \triangleleft and Wu \triangleright \triangleleft \triangleright \bigcirc \bigcirc \bigcirc \bigcirc

Supervised Learning

In supervised learning, the problem is well-defined:

- ullet Given a set of observations ${f X},{f Y}$
- Estimate the density $Pr(\mathbf{Y}, \mathbf{X})$
- Usually the goal is to find the model/parameters to minimize a loss, $L(\mathbf{Y}, f(\mathbf{X}))$
- A common loss is the Expected Prediction Error:

$$EPE(f) = E(\mathbf{Y} - f(\mathbf{X}))^2$$

 Objective Criteria exist to measure the success of a supervised learning method

4□▶ 4□▶ 4□▶ 4□▶ □ 900

Introduction Jan 16, 2024 12 / 43

Unsupervised Learning

In unsupervised learning, there is no output variable, all we observe is a set X.

The goal is to infer Pr(X) and/or some of its properties.

- Low dimension: non-parametric density estimation if possible
- High dimension: need to simply properties without density estimation, or apply strong assumptions to estimate the density.

There is no objective criteria from the data themself

- Heuristic arguments
- External information
- Evaluate based on properties of the data

13 / 43

Classification

The general scheme.
An example.

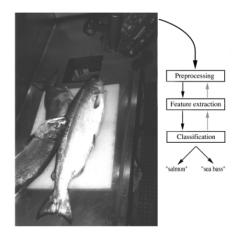

FIGURE 1.1. The objects to be classified are first sensed by a transducer (camera), whose signals are preprocessed. Next the features are extracted and finally the classification is entited, here either "salmon" or "sea bass." Although the information flow is often chosen to be from the source to the classifier, some systems employ information flow in which earlier levels of processing can be altered based on the tentative or pre-liminary response in later levels (gray arrows). Yet others combine two or more stages into a unified step, such as simultaneous segmentation and feature extraction. From: Richard O. Duda, Peter E. Hart, and David G. Stork, Pattern Classification. Copyright © 2001 by lohn Wiley & Sons, Inc.

Classification

count

In most cases, a single feature is not enough to generate a good classifier.

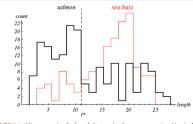

FIGURE 1.2. Histograms for the length feature for the two categories. No single threshold value of the length will serve to unambiguously discriminate between the two categories; using length alone, we will have some errors. The value marked !! will lead to the smallest number of errors, on average. From: Richard O. Duda, Peter E. Hart, and David G. Stork, *Rattern Classification. Copyright © 2001 by John Wiley & Sons, Inc.

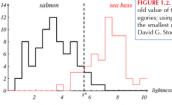

FIGURE 1.3. Histograms for the lightness feature for the two categories. No single threshold value x* decision boundary) will serve to unambiguously discriminate between the two categories; using lightness alone, we will have some errors. The value x* marked will lead to the smallest number of errors, on average. From: Richard O. Duda, Peter E. Hart, and David G. Stork, Pattern Classification. Copyright © 2001 by John Wiley & Sons, Inc.

Classification

Two extremes: overly rigid and overly flexible classifiers.

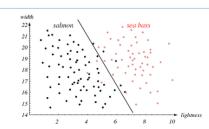

FIGURE 1.4. The two features of lightness and width for sea bass and salmon. The dark line could serve as a decision boundary of our classifier. Overall classification error on the data shown is lower than if we use only one feature as in Fig. 1.3, but three will still be some errors. From: Richard O. Duda, Peter E. Hart, and David G. Stork, Pattern Classification. Convinith G. 2001 by John Wileo & Sons. Inc.

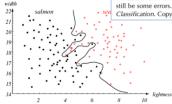

FIGURE 1.5. Overly complex models for the fish will lead to decision boundaries that are complicated. While such a decision may lead to perfect classification of our training samples, it would lead to poor performance on future patterns. The novel test point marked? is evidently most likely a salmon, whereas the complex decision boundary shown leads it to be classified as a sea bass. From: Richard O. Duda, Peter E. Hart, and David G. Stork. Pattern Classification. Convripth © 2001 by Iohn Wiley & Sons. Inc.

Classification

Goal: an optimal trade-off between model simplicity and training set performance.

This is similar to the AIC / BIC / model selection in regression.

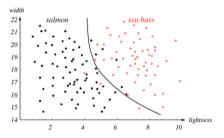

FIGURE 1.6. The decision boundary shown might represent the optimal tradeoff between performance on the training set and simplicity of classifier, thereby giving the highest accuracy on new patterns. From: Richard O. Duda, Peter E. Hart, and David G. Stork, Pattern Classification, Copyright © 2001 by John Wiley & Sons, Inc.

Classification

A classification project:

a systematic view.

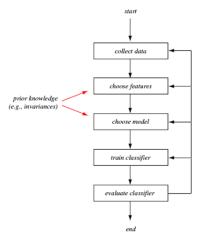

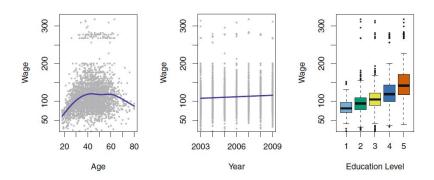

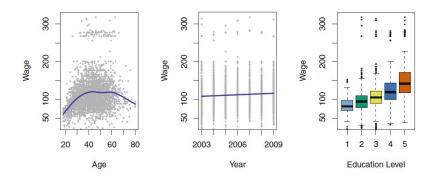

FIGURE 1.8. The design of a pattern recognition system involves a design cycle similar to the one shown here. Data must be collected, both to train and to test the system. The characteristics of the data impact both the choice of appropriate discriminating features and the choice of models for the different categories. The training process uses some or all of the data to determine the system parameters. The results of evaluation may call for repetition of various steps in this process in order to obtain satisfactory results. From: Richard O. Duda, Peter E. Hart, and David G. Stork, Pattern Classification. Copyright © 2001 by John Wiley & Sons. Inc.

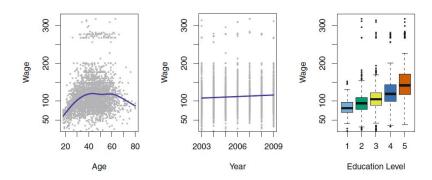

Wages for a group of males from the Atlantic region.

19 / 43

Left panel: wage \sim age wage increases with age, but decrease after 60 Use the blue curve to predict wage using age significant amount of variability around average wage value "Age" alone is insufficient for an accurate prediction.

Introduction Jan 16, <u>2024</u> 20 / 43

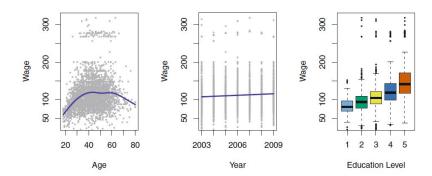

Mid panel: wage \sim year

Around \$10k wage increase per year on average under linear model

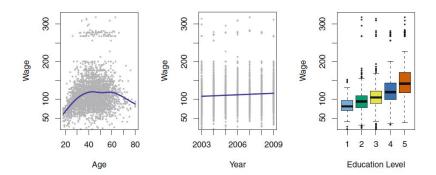

◄□▶◀圖▶◀불▶◀불▶ 불 쒸٩○

Introduction Jan 16, 2024 21 / 43

Right panel: wage \sim education (1) — no high school diploma (5) — Advanced graduate degree Men with higher education levels tend to have higher wagers

Introduction Jan 16, 2024 22 / 43

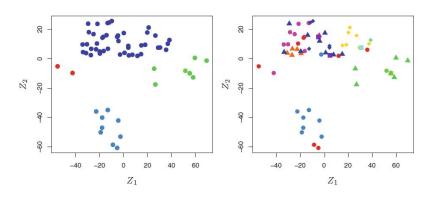

Ideally, more accurate wage prediction of wage can be obtained by combining age, year and education.

Consider non-linear modeling: polynomial regression, spline, Generalized Additive Models (GAM)

10/10/12/12/2

Introduction Jan 16, 2024 23 / 43

Gene Expression Data Clustering

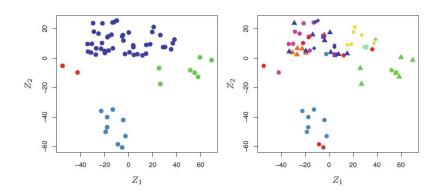

Dataset NCI60: A matrix of 6,830 gene expression measurements for each of 64 cancer cell lines.

Are there any groups (clusters), among the cell lines based on their gene expression measurements?

Introduction Jan 16, 2024 24 / 43

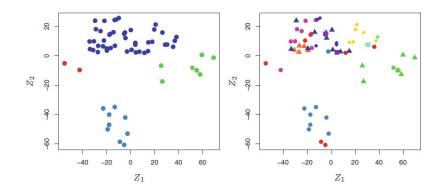

Gene Expression Data Clustering

Principal Component Analysis was adopted Z_1 : 1st PC dimension; Z_2 : 2nd PC dimension

Introduction Jan 16, 2024 25 / 43

Gene Expression Data Clustering

Left: Potentially 4 data-driven clusters

Right: 14 types of cancer labeled (external information)

Cell lines with same cencer type tend to be located near each other

Introduction Jan 16, 2024 26 / 43

A brief history of statistical learning

- Early 1800: method of least squares by Legendre and Gauss. Now a.k.a. linear regression
 - First applied in astronomy
 - Robust, easy to interpret, powerful
- 1936: *linear discriminant analysis* by Fisher
- 1940s: logistic regression
- 1970s: generalized linear models (GLM) Nelder and Wedderburn
- 1980s: Improved computing power enables non-linear methods
- 1980s: classification and regression trees, cross-validation
- 1990s: R language, continuous improvement in computing

27 / 43

The Era of Big Data

E.O. Wilson

"We are drowning in information, while starving for wisdom."

Introduction Jan 16, 2024 28 / 43

The Era of Big Data

E.O. Wilson

"We are drowning in information, while starving for wisdom."

Andreas Buja

"There is no true interpretation of anything; interpretation is a vehicle in the service of human comprehension. The value of interpretation is in enabling others to fruitfully think about an idea."

28 / 43

1

Many statistical learning methods are relevant and useful in a wide range of academic and non-academic disciplines, beyond just the statistical sciences.

29 / 43

Many statistical learning methods are relevant and useful in a wide range of academic and non-academic disciplines, beyond just the statistical sciences.

Statistical learning should not be viewed as a series of black boxes.

29 / 43

Introduction

1

Many statistical learning methods are relevant and useful in a wide range of academic and non-academic disciplines, beyond just the statistical sciences.

2

Statistical learning should not be viewed as a series of black boxes.

3

While it is important to know what job is performed by each cog, it is not necessary to have the skills to construct the machine inside the box!

29 / 43

1

Many statistical learning methods are relevant and useful in a wide range of academic and non-academic disciplines, beyond just the statistical sciences.

2

Statistical learning should not be viewed as a series of black boxes.

3

While it is important to know what job is performed by each cog, it is not necessary to have the skills to construct the machine inside the box!

4

Remember to apply statistical learning methods to real-world problems.

Introduction Jan 16, 2024 29 / 43

Review of Linear Algebra

Introduction Jan 16, 2024 30 / 43

Notations

- n: sample size, # of observations
- p: # of variables

For example, in the wage dataset, we have n=3,000 people and p=12 variables (such as year, age, education, and more)

31 / 43

- Scalar: ONE numerical value alone
 - $5,100, n=3,000, a^2$
- **Vector:** A vector of length n is denoted as $\mathbf{a} = (a_i)_n$

$$\mathbf{a} = \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix}$$

- ullet If all elements in a vector are 1, the vector is denoted as ${f 1}_n$
- We will stick to the convention that a vector is always a column vector.

32 / 43

• Matrix: $m \times n$ matrix with elements a_{ij} is denoted as $\mathbf{A} = (a_{ij})_{m \times n}$

$$\mathbf{A} = \left[\begin{array}{ccc} a_{11} & \cdots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{m1} & \cdots & a_{mn} \end{array} \right]$$

Diagonal Matrix:

$$diag(a_1, a_2, ..., a_n) \equiv \begin{bmatrix} a_1 & 0 & \cdots & 0 \\ 0 & a_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & 0 \\ 0 & 0 & \cdots & a_n \end{bmatrix}$$

Introduction Jan 16, 2024 33 / 43

• Identity Matrix: $I_n := diag(1, 1, ..., 1)$

$$\mathbf{I_n} \equiv \begin{bmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & 1 & 0 \\ 0 & 0 & \cdots & 1 \end{bmatrix}$$

• Matrix Transpose: If $A = (a_{ij})_{m \times n}$, then A^T is an $n \times m$ matrix, where $a_{ij}^T = a_{ji}$

$$\mathbf{A} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix}, \text{ then } \mathbf{A}^T = \begin{bmatrix} a_{11} & a_{21} & \cdots & a_{m1} \\ a_{12} & a_{22} & \cdots & a_{m2} \\ \vdots & \vdots & \ddots & \vdots \\ a_{1n} & a_{2n} & \cdots & a_{mn} \end{bmatrix}$$

• Matrix Transpose example:

If
$$\mathbf{A} = \begin{bmatrix} 1 & 5 \\ 2 & 6 \\ 3 & 7 \\ 4 & 8 \end{bmatrix}$$
, then $\mathbf{A}^T = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \end{bmatrix}$

• Symmetric Matrix: If $A = A^T$ then A is symmetric.

$$\mathbf{A} = \begin{bmatrix} 1 & 9 & 5 & 6 \\ 9 & 2 & 6 & 7 \\ 5 & 6 & 3 & 8 \\ 6 & 7 & 8 & 4 \end{bmatrix}$$
 is a symmetric matrix.

Apparently, **identity matrix** and **diagonal matrix** are always symmetric matrices.

35 / 43

• Matrix Sum: If $\mathbf{A}=(a_{ij})_{m\times n}$ and $\mathbf{B}=(b_{ij})_{m\times n}$ then

$$\mathbf{A} + \mathbf{B} = (a_{ij} + b_{ij})_{m \times n}$$

• Matrix Product: If $A = (a_{ij})_{m \times n}$ and $B = (b_{ij})_{n \times p}$, then

$$\mathbf{AB} = (c_{ij})_{m \times p}$$

where

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj}$$

 \bullet Matrix products satisfy $(\mathbf{A}\mathbf{B})^T = \mathbf{B}^T\mathbf{A}^T$

Introduction Jan 16, 2024 36 / 43

$$\mathbf{A} = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \text{ and } \mathbf{B} = \begin{bmatrix} 7 & 10 \\ 8 & 11 \\ 9 & 12 \end{bmatrix} \text{ Then}$$

$$\mathbf{AB} = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \begin{bmatrix} 7 & 10 \\ 8 & 11 \\ 9 & 12 \end{bmatrix}$$
$$= \begin{bmatrix} 1 \times 7 + 2 \times 8 + 3 \times 9 & 1 \times 10 + 2 \times 11 + 3 \times 12 \\ 4 \times 7 + 5 \times 8 + 6 \times 9 & 4 \times 10 + 5 \times 11 + 6 \times 12 \end{bmatrix}$$
$$= \begin{bmatrix} 50 & 68 \\ 122 & 167 \end{bmatrix}$$

It is only possible to compute \mathbf{AB} if : # of columns in $\mathbf{A} = \#$ of rows in \mathbf{B}

Matrix Inverse

- Matrix Inverse Definition: An $n \times n$ matrix \mathbf{A} is invertible (or non-singular) if there is a matrix \mathbf{A}^{-1} such that $\mathbf{A}\mathbf{A}^{-1} = \mathbf{A}^{-1}\mathbf{A} = \mathbf{I}_n$
- An $n \times n$ matrix \mathbf{A} is invertible if and only if $rank(\mathbf{A}) = n$
- Inverse of Product: $(AB)^{-1} = B^{-1}A^{-1}$ if A and B are invertible

Introduction Jan 16, 2024 38 / 43

Vector Product, Norm and Orthogonality

Inner Product:

$$\mathbf{a}^{\mathrm{T}}\mathbf{b} = \sum_{i} a_{i}b_{i}$$

where $\mathbf{a} = (a_i)$ and $\mathbf{b} = (b_i)$ are vectors with the same length.

• Vector norm:

$$||\mathbf{a}|| = \sqrt{\mathbf{a}^T \mathbf{a}}$$

• Orthogonal vectors: $\mathbf{a} = (a_i)$ and $\mathbf{b} = (b_i)$ are orthogonal vectors if $\mathbf{a}^T \mathbf{b} = 0$ (i.e. they are perpendicular)

Introduction Jan 16, 2024 39 / 43

Vector Product, Norm and Orthogonality

Inner Product:

$$\mathbf{a}^{\mathrm{T}}\mathbf{b} = \sum_{i} a_{i}b_{i}$$

where $\mathbf{a} = (a_i)$ and $\mathbf{b} = (b_i)$ are vectors with the same length.

Vector norm:

$$||\mathbf{a}|| = \sqrt{\mathbf{a}^T \mathbf{a}}$$

• Orthogonal vectors: $\mathbf{a} = (a_i)$ and $\mathbf{b} = (b_i)$ are orthogonal vectors if $\mathbf{a}^T \mathbf{b} = 0$ (i.e. they are perpendicular)

Introduction Jan 16, 2024 40 / 43

Eigenvalue and Eigenvectors

• **Definition:** Given an $n \times n$ matrix ${\bf A}$, then if a scalar λ and a vector ${\bf u}$ satisfy

$$\mathbf{A}\mathbf{u} = \lambda \mathbf{u}$$

then ${\bf u}$ is called an eigenvector of ${\bf A}$, with associated eigenvalue λ .

• Intuition: Eigenvector is a direction in multidimensional space. The linear transformation, A, can't rotate this direction like on others. Instead, A can only stretch/squeeze/reverse this direction.

41 / 43

Eigenvalue and Eigenvectors

Basic Properities:

Let matrix **A** be a $n \times n$ square matrix with $rank(\mathbf{A}) = n$.

Define a square matrix ${\bf Q}=({\bf u_1},{\bf u_2},...,{\bf u_n})$, whose columns are the n linearly independent eigenvectors of ${\bf A}$.

Define diagonal matrix $\mathbf{\Lambda} = diag(\lambda_1, \lambda_2, ..., \lambda_n)$, where each diagonal element is the eigenvalue associated with the each column of \mathbf{Q} . Then from the basic defination we have:

$$\mathbf{AQ} = \mathbf{Q}\mathbf{\Lambda}$$

Because the columns of ${\bf Q}$ are linearly independent, ${\bf Q}$ is full rank and thus invertible. Right multiplying both sides by ${\bf Q}^{-1}$:

$$\mathbf{A} = \mathbf{Q} \mathbf{\Lambda} \mathbf{Q}^{-1}$$
